SUMMARY

AI engineer who puts LLM features into production software, in Python and TypeScript. I built and own my company's deed retrieval service and the MCP server that connects it to our internal AI Hub, and I lead the Hub's frontend.

EXPERIENCE

AI Developer | United Financial Resources | Bradenton, FL | April 2026 to Present

- Built the deed retrieval service from scratch and own it, to replace a manual lookup that takes 10 to 30 minutes. Given an owner name and a county, it finds the county's records portal, runs the search, checks the PDF with a vision model and returns the deed.
- Lead the frontend of AI Hub, a multi-agent chat app used by about 60 employees (Next.js 16, React 19, TypeScript). Designed and shipped the full interface redesign on my own, and fixed a streaming race that lost or merged up to 75% of agent replies when messages were sent in quick bursts.
- Wrote Python and Playwright integrations for 70+ records-portal platforms, covering 840+ counties set up for automated search. Each platform has its own search flow, and some add a login or a paywall. Purchases on paid portals need explicit authorization and are logged.
- Built an LLM agent with tool calling that diagnoses broken portal configurations and proposes fixes, capped by iterations and gated by human-in-the-loop approval in Teams before it changes a county's validation or retrieval settings. Runs on a self-hosted model and cannot reach a public LLM API.
- Designed a recovery path for counties whose usual route fails. Now rolling out platform by platform, it tries the alternatives in order and reports each step, so “found nothing” is never confused with “couldn’t search.” CI runs 7,500+ tests inside the shipped image.
- Wrote the authenticated MCP server that exposes deed search to the AI Hub's agents, keeping PDFs out of the model's context window.

Freelance Software Developer (part-time) | Self-employed | Remote | January 2025 to Present

- For a psychology practice, built the website, course sales pages and ConsciencIA, a journaling app where patients get AI feedback on private entries, encrypted at rest and covered by item-by-item consent (Astro, PHP, MySQL).

Earlier: Insurance Agent, healthinsurance.com (2024 to 2025) · Warehouse Operations Associate, Amazon Robotics (2023 to 2024) · Production Associate, Tesla (2018 to 2023)

SELECTED PROJECT

Forja | Offline-first training app | Closed TestFlight beta, web app live

- Training app for lifting, HYROX and cardio, with block workouts (AMRAP, EMOM, for time), programs, habits and progress in one place. Built solo with 5,000+ tests. The phone holds the data and a custom engine syncs it to Supabase in the background, so workouts log with no connection.
- Fixed a data-loss bug with tombstone last-write-wins, enforced from the client merge down to a Postgres trigger and covered by property-based tests that simulate two devices with skewed clocks.

TECHNICAL SKILLS

AI: LLM agents and tool use, Model Context Protocol (MCP), self-hosted models through LiteLLM and OpenAI-compatible APIs, Anthropic Claude API, Gemini API, LangGraph, vision-model document checks

Backend: Python, FastAPI, asyncio, NATS JetStream, PostgreSQL (row-level security), REST APIs

Frontend: TypeScript, React, Next.js, React Native, Expo, Zustand, Tailwind CSS

Testing and DevOps: pytest, Vitest, Jest, Playwright, property-based testing, Docker, GitHub Actions, CI/CD

Languages: English (native), Portuguese (native), Spanish (fluent)

EDUCATION

Systems Analysis and Development coursework | Anhanguera Educacional | 2024 to 2025

Web Development coursework | Truckee Meadows Community College | 2019 to 2020
